

HOW DOES IT WORK?

The **ENDOLIFT®** treatment is only medical and is always performed in day surgery.

Specific single-use micro optical fibers, a bit thinner than a hair (**FTF Eufoton**), are easily inserted under the skin into the superficial hypodermis.

The procedure does not require incisions or anesthesia and it does not cause any kind of pain. No recovery time is required, so it is possible to return to normal activities and to job within a few hours.

Results are not only immediate and long-term, but continue to improve for several months following the procedure, as additional collagen builds in the deep layers of the skin.

As with all procedures in aesthetic medicine, the response and the duration of the effect depends on each patient and, if the physician deems it necessary, **ENDOLIFT®** can be repeated with no collateral effects.

WHAT IS ENDOLIFT®?

ENDOLIFT® is a minimally invasive outpatient laser procedure used in endo-tissutal (interstitial) aesthetic medicine.

The treatment has multiple purposes: the remodeling of both deep and superficial layers of the skin, toning, the retraction of connective septums, the stimulation of collagen production and, when necessary, the reduction of excessive fat.

The main activity of **ENDOLIFT®** is promoting "skin tightening", in other words the retraction and reduction of skin laxity thanks to the activation of neo-collagenesis and of metabolic functions in the extra cellular matrix.

The "skin tightening" created by **ENDOLIFT®** is strictly linked to the selectivity of the laser beam used, that is, to the specific interaction of the laser light which selectively hits two of the main targets of the human body: water and fat.

ADVANTAGES

- No anesthesia, only cooling;
- Safe, visible and immediate results;
- Long-term effect;
- A unique session;
- No incisions;
- Outpatient treatment;
- No or minimum convalescence;
- Possibility of therapeutic combination with fractional non-ablative laser (LIGHTSCAN™ 1500).

INDICATIONS

Face results

Mandibular contour

Lower eyelid

Neck

Chin

Body results

Periombelical area

Gluteus

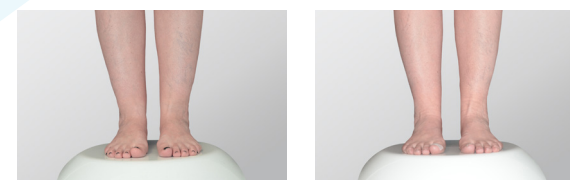

Knees

Inner thigh

Ankles
